Hospital Operations & Patient Analytics

Dashboard Wireframes | Reconstructed from the four Tableau screenshots supplied

Purpose and scope

These wireframes document the actual dashboard structures shown in the supplied Tableau screenshots. They are layout representations, not replacement dashboards or fabricated screenshots. Dashboard titles, KPI labels and chart titles follow the visible Tableau work.

1. Hospital Overview

Five KPI cards across the top; admissions by medical condition at lower left; monthly trend and admissions by type stacked at right.

2. Patient Flow

Three KPI cards across the top; monthly admissions trend across the middle; length-of-stay histogram and admissions by type along the bottom.

3. Medical Condition Analysis

Three KPI cards across the top; admissions by condition at left; average LOS and billing by condition stacked at right.

4. Resource Utilization

Two KPI cards stacked at left; beds by hospital/facility type in the centre; average monthly footfall by hospital/facility type at right.

Data source note: Patient Admissions and PMC Hospital Infrastructure remain separate datasets. These dashboards do not imply a facility-level join.

Dashboard 1: Hospital Overview

Purpose: High-level view of admissions, patient characteristics, billing and admission patterns.

Screenshot-matched layout: Five KPI cards form one horizontal row. The condition bar chart occupies the larger lower-left area. The monthly trend is at upper right and admission type is below it.

Dashboard 2: Patient Flow

Purpose: Examine admission movement over time, stay-duration distribution and admission type.

Total Admissions
KPI card

Average Length of Stay
KPI card

Emergency Admissions
KPI card

Monthly Admissions Trend
Wide line chart: Month of Date of Admission by count of Name. Date range filter visible at upper-right.

Length of Stay Distribution
Histogram: Length of Stay (Days) bins by count

Admissions by Type
Columns: Admission Type by count of Name

Screenshot-matched layout: Three KPI cards across the top. The trend spans most of the width below them. The histogram and admission-type chart share the bottom row.

Dashboard 3: Medical Condition Analysis

Purpose: Compare medical conditions using admission volume, average length of stay and total billing.

Total Admissions
KPI card

Average Length of Stay
KPI card

Total Billing Amount
KPI card

Admissions by Medical Condition
Horizontal bars: Medical Condition by count of Name

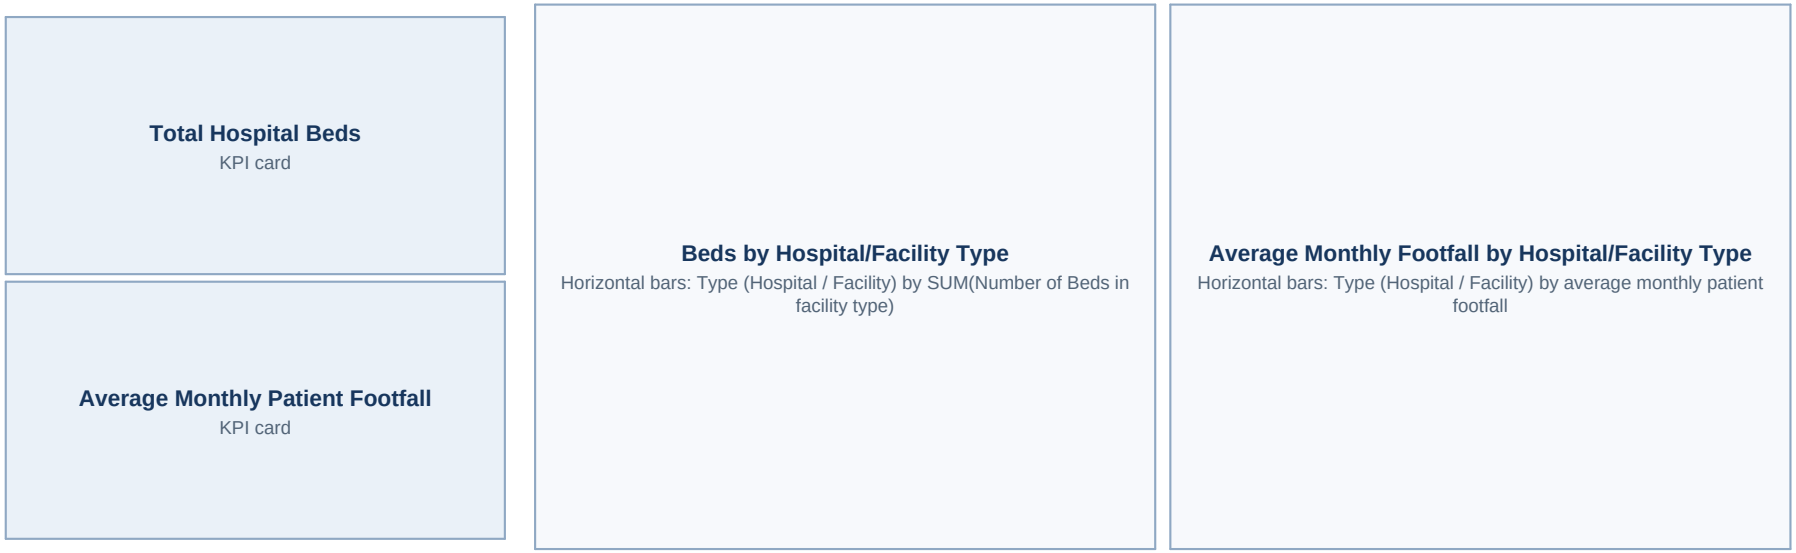
Average LOS by Medical Condition
Horizontal bars: Medical Condition by average Length of Stay (Days)

Total Billing by Medical Condition
Horizontal bars: Medical Condition by sum of Billing Amount

Screenshot-matched layout: Three KPI cards across the top. Admissions by condition fills the lower-left region; average LOS and total billing by condition are stacked at right.

Dashboard 4: Resource Utilization

Purpose: Summarize reported hospital bed capacity and average monthly patient footfall across categories in the PMC infrastructure data.



Screenshot-matched layout: Two KPI cards are stacked in the left column. Beds comparison is in the centre and footfall comparison is on the right.
Actual dimension name: Type (Hospital / Facility). 'Facility type' is descriptive shorthand, not the literal field name.
Interpretation: Total beds represents reported capacity, not occupied or available beds. No bed occupancy or utilization rate is calculated.

Data definitions and interpretation notes

Notes retained to keep the wireframes aligned with the visible dashboards and the available fields.

Item	Definition / limitation
Total Admissions	Counts non-null Name records in the patient admissions data. This is a count of admission records, not distinct patients.
Average Length of Stay	Average of Length of Stay (Days) in the patient admissions data.
Total Billing Amount	Sum of Billing Amount in the patient admissions data. Recorded billing is not necessarily cash collected or profit.
Emergency Admissions	Count of records classified as Emergency under Admission Type.
Medical Condition	Condition category used in Dashboards 1 and 3. It is not a department field.
Hospital/facility type	Uses the actual PMC infrastructure dimension Type (Hospital / Facility).
Total Hospital Beds	Sum of Number of Beds in facility type. Represents reported capacity, not occupied or available beds.
Average Monthly Patient Footfall	Infrastructure measure shown as a KPI and by Type (Hospital / Facility).
Data source separation	Patient Admissions and PMC Hospital Infrastructure remain separate. No shared facility key or join is represented.
